

Portable Toilet SOP's

Portable toilet facilities are ventilated and screened and have self-closing doors that can be closed and latched from the inside.

We require that the maintenance service place the facilities at least 25 feet from the fields.

Field Sanitation Unit/Toilet Facility Spill Response Plan

The following steps are taken in the event of a major spill or leak of a Field Sanitation Unit or Toilet Facility Leak:

1. The source of the leak or spill is identified, and efforts are made to stop it.
2. If the spill affects crop production areas, the areas are quarantined, and the affected crops are disposed of.
3. An alternative field sanitation unit/toilet facility is provided, if needed.
4. As far as practicable, the area is cleaned and disinfected.
5. Any further servicing is performed, as needed.

If the water used for hand washing in field sanitation units does not meet EPA potable water standards for bacteria, chlorine or other acceptable agents must be added to reduce the possibility of microbial contamination.
